Car Wash Management System

SuperShine is a self-service carwash. Your job is to develop a car wash system for *SuperShine.*

Software construction
We will have a class discussion about the structure of the Java program and based on the discussion and the developed use case diagram and descriptions, you will develop **part of** the designed system.

- The system must be able to handle that a customer can only buy the car wash if she/he has enough money on his WashCard.
- The system must have different wash types with different prices.
- Add implementations of other use cases of your choice.

  The developed system is a "red" (required) assignment in software construction and must be handed in to Fronter as a group hand in.

  The code should be organized in packages with a logical architecture.
